Dear Mayo Clinic Platform Product Design team,

I'm applying for the Digital Product Designer – UX role because I want to join an organization that puts the needs of the patient first in all that it does. I've witnessed the impact of that kind of commitment up close because Mayo Clinic has been part of my mom's life for nearly two decades.

My mom was diagnosed with a disorder that forced her to retire early. One day, she met a new specialist and they happened to be affiliated with Mayo. After assessing her, they offered to recommend her to the clinic. We knew Mayo had an outstanding reputation and it felt like our family won the lottery when she was accepted as a new patient. Mayo has been a caring partner to her as she's navigated uncertainty and has had to adjust to new, life-long diagnoses. Beyond the care, she values Mayo's rigor and trusts it above every other option she's had. In fact, she once drove two hours through snow to get to your Arizona campus in the middle of a medical emergency. (She's well now, and we've convinced her to move so she's just twenty minutes away.)

I've also experienced healthcare from both sides, as a patient and as a digital health vendor.

I have two young kids. Before each delivery, I was hospitalized for weeks. Both were born prematurely, and each spent two months in the NICU. Both times, our care was better than I could have wished for. Those experiences showed me what patient- and family-centered care looks like when both the patients and the healthcare team are well supported.

At CareSignal, the remote patient monitoring company I co-founded, I learned how to support clinicians by shadowing nurse care managers and doctors and interviewing patients. Insights from those activities allowed me to design a clinician application that let one nurse safely oversee 1,500 patients instead of 100. I later codified CareSignal's vision, "to highlight key moments for life-changing intervention, accentuating the care our partners provide," and our values: Accessible, Caring, Impactful, Expert. They named choices we'd already made, like monitoring over plain-language text messages and phone calls instead of devices, because the patients who most needed monitoring were the least likely to pair a Bluetooth scale. And they kept us focused as we grew. That "deviceless" approach went on to win Best in KLAS in Remote Patient Monitoring.

That's why the way Mayo Clinic writes about its Mission and Values resonates so deeply with my approach to product design. Mayo Clinic Platform is designing for patients and clinicians at a scale and with a research rigor I haven't yet worked in, and that's compelling to me. I'd bring a healthcare UX background grounded in clinical workflows and patient-reported data. I hope to learn what it takes to keep the patient first across everything Mayo builds.

Thank you for your consideration,
